

The EHR that works as hard as you do.

AI-first. FHIR-native. Offline-capable. Fully connected.

Built for clinicians who demand precision — and institutions that refuse to settle for less.

STANDARDS & COMPLIANCE

HIPAA	FHIR R4/R5	HL7	ICD-10	SNOMED
FHIR R4 / R5 Full interoperability		DHIS2 Bidirectional Real-time two-way sync		8 Languages SADC-native from day one

WHY SWITCH TO UMOYA

Your current system is costing you more than you think.

Most clinic systems were built before AI, before FHIR, before mobile-first medicine. They slow your staff, silo your data, and leave clinical intelligence untapped. Umoya was built from the ground up to change that.

Data Trapped in Silos

Billing, clinical, and lab records that never talk to each other. Umoya unifies every encounter into one longitudinal patient record — accessible from any device, even offline.

No Clinical AI Layer

Your current system shows data. Umoya interprets it. Drug interaction hard-stops, 30-day mortality risk scores, nightly care-gap flags, and AI-generated discharge summaries — surfaced before the patient leaves.

FHIR Dead-Ends & Manual Re-Entry

Referrals, lab imports, and insurer integrations still require copy-paste. Umoya is FHIR R4/R5 native — bidirectional, real-time, zero manual rekeying with any standards-compliant system.

Research Potential Going to Waste

Your patient data can drive publishable science. Umoya's de-identified cohort builder, Kaplan-Meier survival curves, and VigiBase pharmacovigilance reporting turn routine care into evidence — with no extra data entry.

DHIS2 & Ministry Reporting Is Manual

Automatic bidirectional DHIS2 sync means HIV cascade, NCD registers, and SDG 3 metrics are submitted without a single spreadsheet or a phone call to the ministry.

CLINICAL CAPABILITIES

AI Clinical Decision Support Drug-drug hard-stops, dosing alerts, 30-day mortality risk badge on every patient. Nightly composite scoring with automatic nurse alerts.	Smart Prescribing Formulary optimisation, PDMP controlled substance monitoring, and AI drug substitution when a medicine is unavailable.	Digital Documentation Ambient voice transcription, AI-generated discharge summaries, referral letters, pre-authorisations, and paperless e-signature consent.
Laboratory & Imaging DICOM viewer with AI heatmap overlays, critical result alerts, and dual AI interpretation — clinical and plain-language for patients.	Inpatient & Theatre Bed management, ADT, BCMA medication administration, and OR Gantt board with utilisation %, on-time start rate, and turnover time.	HIV Centre of Excellence CDPA 2021 compliance, ART regimen-switch engine, MMD scheduling, 95-95-95 cascade reporting, and adolescent disclosure tools.
NCD & Specialty Registers Diabetes foot exams, CKD GFR staging, CVD risk, SCD register, epilepsy/AED prescribing, oncology, maternity, ophthalmology.	Pharmacy & Inventory Multi-location FEFO dispensing, cold-chain tracking, AI demand forecasting, and cross-facility stock balancing.	Population Health & Care Gaps Proactive cohort analytics — overdue screenings, lapsed follow-ups, and risk stratification across your entire patient panel.

INTEROPERABILITY & RESEARCH

FHIR R4/R5 — Fully Native Umoya does not bolt FHIR on — it is the data model. Every patient resource is a standards-compliant FHIR object. Referral networks, insurers, national registries, and lab partners connect bidirectionally with zero manual re-entry. Supports bidirectional real-time exchange, insurer & lab integration, and SMART on FHIR apps.	DHIS2 Bidirectional Sync Aggregate and tracker data flows both ways — automatically. Facility reports, HIV cascade metrics, NCD registers, and SDG 3 indicators submitted without spreadsheet exports. HIV 95-95-95 cascade, NCD & mortality dashboards, PEPFAR & MOHCC ready.	Clinical Research Platform HIPAA Safe Harbor de-identification (18 PHI fields), Kaplan-Meier survival curves with Greenwood 95% CI, VigiBase adverse event reporting, and time-limited external collaborator access — no EHR account required.
--	--	--

THE SWITCH IS STRAIGHTFORWARD

01 Data Migration Existing patient records, medications, and history are imported. No blank slate — continuity from day one.	02 API Bridge Current lab, imaging, and billing integrations connect via FHIR adapters. No downtime during transition.	03 Staff Onboarding Role-based training per department. Most clinical staff are confident within two sessions.	04 Parallel Go-Live Both systems run simultaneously. Cut over only when your team is fully ready.
--	--	--	---

Your patients carry a clinic in their pocket.

The Umoya clinical companion app extends your clinic beyond its walls. Patients stay connected, informed, and engaged between visits — while you and your staff spend less time on admin and more time on care.

Zero waiting-room paperwork Intake completed on the patient's phone before arrival.	Live queue & wait time Patients see their position in real time.
Video & voice telemedicine HD consultations with full EHR context.	EcoCash / ZiG payments Bills settled from the app; staff notified instantly.

THE PATIENT JOURNEY — FROM PHONE TO CONSULTING ROOM

1 Before the Visit 48 hours before arrival the patient receives an SMS or push notification. They complete demographics, chief complaint, medications, allergies, and consent on their own device. Encounter pre-populated on arrival.	2 Arrival & Check-In Patient taps 'I'm Here.' An encrypted QR code is generated. Nurse scans it and the full record opens instantly — no paper, no typing. Live queue position shown on their screen.	3 During the Consultation Doctor works in the Umoya EHR while the patient follows along — viewing the care plan, consenting digitally, and receiving lab or imaging requests the moment they are placed.	4 After the Visit Discharge summary, prescriptions, and follow-up instructions arrive in the patient's language. Post-visit survey sent 2–4 hours later. AI-scheduled follow-up reminder fires at exactly the right interval.
--	---	--	---

TELEMEDICINE — CARE WITHOUT BOUNDARIES

Video & Voice Consultations Umoya's built-in telemedicine connects doctor and patient through HD video or voice — with the full EHR open alongside every call. Vitals, medications, history, and imaging are a click away. The doctor can issue prescriptions, lab orders, and referrals before the call ends — everything lands in the patient's app immediately.	For the doctor • Full EHR context during every call • Issue Rx, labs & referrals mid-consultation For the patient • Consult from home — no travel, no waiting room • Receive prescriptions directly to the app • Review visit notes and care plan after the call • Pay for the consultation in-app instantly

CONTINUOUS CARE — WEARABLES & HOME MONITORING

Apple Health & Google Fit

Background sync of steps, heart rate, sleep, and SpO2. Trends visible in the EHR as 7-day sparklines per vital.

Bluetooth BP & Glucometers

Standard BLE pairing. Readings stored with clinical reference range checking. Abnormal values flagged immediately.

AI Trend Alerts

Three consecutive abnormal readings within 24 hours trigger an automatic alert to the care team — before a crisis develops.

Family & Household Risk

Linked household members share health status (privacy-safe). Infectious or heritable diagnoses raise alerts for the whole family.
